Exponent®
Engineering & Scientific Consulting

Meredith Sellers, Ph.D., P.E., CEng

Principal Engineer | Metallurgical and Corrosion Engineering
Menlo Park
+1-650-688-7306 | msellers@exponent.com

Professional Profile

Dr. Sellers offers expertise in asset integrity, materials performance, and process reliability across a wide range of industries. Her work often focuses on the interplay between operating conditions and the performance of systems, piping, equipment, and products. Drawing on deep chemical engineering, materials science, and corrosion expertise, she consults directly with industry partners and provides technical support in litigation and arbitration matters.

Dr. Sellers specializes in process-driven failure analysis and integrity management, helping clients understand how system design, material selection, and operating conditions interact to ensure reliability and safety across complex industrial operations. As a Licensed Professional Chemical Engineer, Chartered Chemical Engineer, and NACE Certified Corrosion Technician, she combines practical knowledge of real-world processes with a rigorous understanding of industry standards (API, NACE, ASME) to deliver actionable insights that help clients prevent failures and improve operations.

Dr. Sellers is a long-standing member of the Society of Women Engineers (SWE) and the Association for Women in Science (AWIS), and an active participant in community science, technology, engineering, and mathematics outreach activities. She currently serves as the Co-Chair of the Equal Representation for Expert Witnesses (ERE) initiative.

Oil & Gas

Dr. Sellers has investigated failures and performance issues at refineries, offshore platforms, and liquefied natural gas (LNG) facilities. She focuses on damage mechanisms (e.g., corrosion, stress corrosion cracking, hydrogen embrittlement) affecting process piping and vessels from a chemical engineering perspective, including the evaluation of operating temperatures, pressures, and process fluids. She has led root cause investigations of units and equipment such as reactors, heaters, heat exchangers, separators, pressure vessels, pumps, turbines, gaskets, valves, and analyzers/indicators/gauges.

She has also assisted operators and owners in assessing integrity management programs, including inspection practices, damage mechanism reviews, and fitness-for-service evaluations. Her work regularly requires analysis of process flow diagrams (PFDs), piping and instrumentation diagrams (P&IDs), and inspection isometrics. She draws upon her Certified Risk Based Inspection Professional (API 580) and NACE Certified Corrosion Technician credentials, as well as extensive experience with federal and international code requirements and industry standards pertinent to process piping and natural gas utilities.

Industrial Process Facilities

Dr. Sellers has extensive experience evaluating systems, piping, and equipment in industrial process facilities including those used for pharmaceutical and polymer manufacturing, medical device sterilization, fertilizer and food production and storage, and biowaste processing, among others. She has investigated failures at large- and small-scale facilities, including those resulting in loss of containment events. She also assists clients who are designing and updating facilities with material selection questions and challenges.

Consumer Products and Medical Devices

Using her familiarity with materials characterization techniques, Dr. Sellers assists consumer products and medical device clients in investigating potential issues identified during design, manufacturing, testing, and use. She routinely consults on materials selection and performance, contamination analyses, process development and validation, extractable and leachable assessments, and product reliability evaluations and recalls.

Semiconductor Manufacturing and Thin Film Characterization

Dr. Sellers leverages her thin film synthesis and characterization background to help troubleshoot issues with integrated circuit fabrication equipment and semiconductor manufacturing processes. She has investigated the impacts of process upsets on tool integrity as well as failures of furnaces, deposition chambers, implanters, vacuum pumps, and etching systems. She has experience reviewing process documentation for historic and modern semiconductor manufacturing operations to inform toxicological and environmental assessments.

Professional Background

Prior to joining Exponent, Dr. Sellers was a postdoctoral researcher at the U.S. Army Engineer Research and Development Center – Construction Engineering Research Laboratory (ERDC-CERL), where she developed and evaluated carbon nanotube, graphene, and metal oxide-based supercapacitors. Her doctoral thesis research at the University of Illinois at Urbana–Champaign (UIUC) focused on the chemical vapor and atomic layer deposition (CVD/ALD) of titanium dioxide and the optimization of its electrical properties for photocatalysis and supported metal catalysis. This entailed the extensive use of materials characterization techniques such as X-ray diffraction (XRD), X-ray photoelectron spectroscopy (XPS), and scanning electron microscopy/energy dispersive X-ray spectroscopy (SEM/EDS).

Before entering graduate school, Dr. Sellers held research appointments in the Micro-Total-Analytical Systems and Entry Control & Contraband Detection Technologies organizations at Sandia National Laboratories and in the Department of Chemistry at University College London.

Academic Credentials & Professional Honors

Ph.D., Chemical Engineering, University of Illinois, Urbana-Champaign, 2011

M.S., Chemical Engineering, University of Illinois, Urbana-Champaign, 2008

B.S., Chemical Engineering, Cornell University, 2005

Harry G. Drickamer Research Fellowship, UIUC 2009-2010

National Science Foundation Graduate Research Fellowship 2006-2009

BP Fellow, UIUC 2005-2006

Project Experience

Oil & Gas

Dr. Sellers has experience with upstream, midstream, and downstream oil and gas operations, assisting in multidisciplinary failure investigations as well as advising industrial clients. Selected examples of this work include:

- Damage mechanism assessment: Surveyed and evaluated refinery, offshore platform, and LNG facility systems and components potentially susceptible to damage mechanisms (e.g., sulfidation corrosion, stress corrosion cracking, atmospheric corrosion, corrosion under insulation) as a function of service and/or environmental conditions.
- Inspection regime review: Reviewed facility, unit, and component-level inspection programs and regimes for refineries and offshore platforms, including the results of non-destructive testing (e.g., radiographic testing, ultrasonic testing) and repair and mitigation documentation.
- Failure analysis: Investigated refinery, offshore platform, and undersea pipeline loss of containment events and system performance impacts attributed to factors such as general and localized corrosion, equipment and component fabrication, material selection, temperature, pressure, and process fluid composition upsets, chemical treatment strategies, cleaning/pigging activities, catalyst quality, and rotating and static equipment maintenance.
- Risk-based inspection: Evaluated risk-based inspection programs for piping and pressure vessels at refineries and offshore platforms, focusing on operator assessments of likelihood and consequence of failure, as well as the determination of inspection frequencies and methodologies.
- Pre-commissioning, commissioning, and start-up evaluation: Assessed hydrotest-related activities (e.g., flushing, draining, drying) and utility demands.

Dr. Sellers has also worked extensively on natural gas integrity management program and projects. A few examples include:

- Direct assessment: Conducted third-party reviews of a natural gas utility's external corrosion direct assessment (ECDA), internal corrosion direct assessment (ICDA), and stress corrosion cracking direct assessment (SCCDA) procedures and practices. Revised program procedures, verified inspection findings, project deliverables, and developed QA/QC frameworks.
- Indirect inspection tool (IIT) data analysis: Reviewed and synthesized the results of surface-level techniques for natural gas pipeline assessments such as close interval surveys (CIS), direct current voltage gradient (DCVG)/alternating current voltage gradient (ACVG) surveys, and soil resistivity testing.

- Cathodic protection (CP): Reviewed historic CP records, CP schemes for new, underground assets, and proposals to upgrade pre-existing CP systems.
- Corrosion control: Carried out gap analyses for natural gas utility involving comparison of operator standards, procedures, and guidance documents to PHMSA, API, ASME, NACE, and ASTM requirements and recommendations.
- Pipeline casings: Evaluated operator in-line inspection (ILI) data and ECDA findings to investigate likelihood of external corrosion occurring at particular locations on cased pipe segments.
- Root cause analysis: Synthesized information about pipeline construction, inspection, and maintenance to understand root causes of leaks, ruptures, and coating deterioration.
- Data asset management: Developed asset registry and data improvement roadmap for critical gas operations datasets.

Industrial Process Facilities

Dr. Sellers has carried out investigations into a broad range of industrial process facilities, assisting clients in understanding system performance under real-world conditions. Examples include:

- Sulfuric acid plant: Evaluated impacts of process factors on boiler leak.
- Refrigeration facilities: Assessed root causes of failures in condensers and heat exchangers.
- Ethylene oxide sterilization facility: Investigated design, testing, and monitoring of sterilizer chamber and aeration emission control equipment (e.g., scrubbers, catalytic oxidation units).
- Thermal power station: Assessed operating impacts on integrity of power plant condensers and feedwater heaters.
- Molybdenum extraction facility: Determined root cause of dry, liquid chlorine release at offloading station.
- Pharmaceutical plants: Executed corrosion testing of candidate materials for plant process piping.
- Trichloroisocyanuric acid (TCCA) warehouse: Evaluated decomposition of TCCA in the context of product packaging integrity and environmental sampling results.
- Gasoline storage tanks: Analyzed fiberglass reinforced plastic shell of steel tank intended for underground storage of flammable and combustible liquids.

Consumer Products and Medical Devices

Dr. Sellers has conducted analyses of consumer products and medical devices for both industrial and legal clients. Examples of these investigations include:

- Drug delivery and percutaneous treatment devices: Analyzed compositional and mechanical properties of metallic, polymeric, and ceramic devices.
- Roofing materials: Characterized metallic roof panels to assess deterioration and damage (e.g., coating defects, corrosion).
- Coated metallic parts: Chemical analysis and simulated use testing of coated consumer electronics and kitchen appliance accessories.
- Food and drink packaging: Performed failure analysis on olive oil bottles, wine bottles, whipped cream cans, among others.

Semiconductor Manufacturing and Thin Film Characterization

Dr. Sellers leverages her foundational microelectronics processing knowledge, including as the co-author of a textbook entitled "Charged semiconductor defects: Structure, thermodynamics, and diffusion," to assist industrial clients and those in the insurance sector. Specific examples include:

- Equipment performance: Evaluated issues such as a pinhole leak in a radio frequency (RF) coil in a laser diode fabrication tool, wafer contamination resulting in slippage during CVD tool handling, and ion implantation underdosing resulting in goodness of fit failures.
- Impact assessments: Assessed impacts of power outages and cooling water system shutdowns on cleanroom operations, equipment performance, and product quality.
- Equipment storage and preservation: Analyzed effects of moisture and debris exposure on tool integrity and operability.
